

## Mabel White's Ultimate Melt & Pour Soap Base

We had this soap base specially formulated just for us. Our goal was to develop an easy to use Melt and Pour base that:

1. Produces an abundant, rich and creamy lather more like Cold Process soap.
2. DOES NOT SWEAT like other Melt and Pour bases.
3. Grabs and holds scent.
4. Produces finished bars with superior emollient and moisturizing qualities.

We tasked our Biochemist to produce a base to our specs, and here it is! The bars harden overnight, and produce beautiful finished soaps.

Instructions:

Dice soap up into chunks and place into microwavable bowl. Heat base in the microwave to 130° F, stirring intermittently for only a minute or two. Do not over heat the soap base. If you heat the soap too high it will create more bubbles than you may care for. Since many melt and pour soap bases are cut with cheap waxes, it often does need more time to melt. Ours does not.

Allow to cool to 120° F, add scent and color, and then pour. Allow to set up before demolding. Because our soap base is so unique, **bars will become harder overnight.**
